The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Process Burners, Process Flares & Thermal Oxidizer Systems market for 2018-2023.

Burner is a device that controls the mixing of air with a combustible fuel to produce a stable flame pattern. In the report, we focused on burners used in oil and chemical industry.

A flare system collects and discharges gas from atmospheric or pressurized process components to the atmosphere to safe locations for final release during normal operations and abnormal conditions. A flare system consists of a flare stack and pipes that feed gas to the stack. The type and amount of gas or liquids in the flare stack governs the sizing & brightness of the flare.

Thermal oxidizers reduce air pollution emissions from a variety of industrial processes. Using the principle of “thermal oxidation,” a combustion process, the contaminants within the polluted exhaust gas react with oxygen in a temperature controlled environment. The chemical oxidation reaction destroys the contaminants in the polluted exhaust gas before discharging it back into the atmosphere. What is released is an innocuous emission of CO₂, water vapor, and heat.

In the next five years, the global revenue of Process Burners, Process Flares & Thermal Oxidizer Systems will maintain a stable annual growth rate, expected in 2023 will be 1283.72 M USD. As Chinese overall economic downward trend in the past few years,

and international economic situation is complicated, in the next few years there will be many uncertainties. In the past few years, more and more companies enter into Process Burners, Process Flares & Thermal Oxidizer Systems industry so overall market competition is fierce.
