In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Protein Chip market for 2018-2023.

Protein Chip is a technique of tracking the activities of proteins. This technique is used for monitoring the expression of the protein and determining the function of large number of protein in a single experiment. Protein chip consists of a surface such as nitrocellulose membrane, microtitre plate, glass slide, and bead. This surface helps in tracking all the activities of proteins. These Protein chips are economical, automated, rapid, highly sensitive and capable of tracking minute quantities of reagents/ sample. The application of protein chip includes antibody characterization, analysis of protein functions, proteomics, and diagnostics. Protein chips also overcome the major restraint of the conventional DNA microarray. DNA microarray was unable to monitoring the level of gene expression in proteomics.

Over the next five years, LPI(LP Information) projects that Protein Chip will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
