Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Put to Light System market for 2018-2023. Put to Light systems are an effective automated sortation method to break larger quantities of product into individual customer orders, using light devices to direct operators to 'put' items. Sometimes the Put to Light approach is referred to as 'scan and sort'. Merchandise that is typically batch picked beforehand is brought to a put station. Operators scan bar codes on individual pieces of merchandise, then lights turn on at any individual customer orders requiring that product.

Based on business rules and the put to light device used, operators might also have the ability to short a put to a container or split a put across multiple containers for the store or order. Other features within put to light include closing containers, indication of a full container to close, opening a new container and configurable scan verification as you open a container for the location.

Over the next five years, LPI(LP Information) projects that Put to Light System will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
