## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Selective Laser Melting Machines market for 2018-2023.

Selective Laser Melting is an additive manufacturing technique that can print metal parts in 3D. A laser is used to melt metallic powder in specific places. Selective laser melting uses a laser to melt successive layers of metallic powder. The laser will heat particles in specified places on a bed of metallic powder until completely melted. The CAD 3D file dictates where melting will occur.

During the sieving process the rough particles are sieved out and are separated in an overflow bottle. The reusable metal powder, which has the defined grain size, is transported to the storage container and can be directly used again.

Over the next five years, LPI(LP Information) projects that Selective Laser Melting Machines will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
