The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Site-Specific Drug Delivery market for 2018-2023.

The selective delivery of chemotherapeutic agents to their site of action should increase therapeutic effectiveness and limit side effects. Most drug therapies currently available, however, exhibit little, if any specificity. Many times, a drug has limited or no access to its intended site of action or is prematurely metabolized or excreted. In other instances, the drug travels rather freely throughout the body and not only acts on the desired target tissues but also causes undesirable effects on nontarget tissues. This lack of target specificity is attributable, for the most part, to the formidable barriers that the body presents to the successful delivery of a drug from its site of administration to its site of action: a drug normally encounters or must by pass various molecules, enzymes, cells, membranes, and organs before reaching its designated target.

The report provides separate comprehensive analytics for the US, Canada, Japan, Europe, Asia-Pacific, Latin America and Rest of World. Annual estimates and forecasts are provided for the period 2018 through 2025. Also, a five-year historic analysis is provided for these markets.
