## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Sodium Fluorosilicate market for 2018-2023.

Sodium fluorosilicate appears as white crystal, crystalline powder or colorless hexagonal crystals. It is odorless and tasteless. Its relative density is 2.68; it has moisture absorption capability. It can be dissolved in a solvent such as ethyl ether but insoluble in alcohol. The solubility in acid is greater than that in water. It can be decomposed in alkaline solution, generating sodium fluoride and silica. After searing (300 ?), it is decomposed into sodium fluoride and silicon tetrafluoride. It is poisonous. At present, as a by-product, most manufacturers of sodium fluorosilicate are located in China. At present, the Chinese government is closing inefficient excess capacity. At the same time, some large manufacturers are building new production lines. In the future, the merger and integration between companies will be the mainstream trend of market development.

In the past five years, the price of sodium fluorosilicate was low due to fierce competition. In the last two years, sodium fluorosilicate began to rebound due to environmental pressure and rising raw material prices. Overall economic performance will continue to be the best indicator of future demand for sodium fluorosilicate. Demand in most downstream markets is greatly influenced by general economic conditions. As a result, demand largely follows the patterns of the leading world economies. In the future, the market in developed countries will have some growth and the market in developing countries will have a faster growth rate.

Over the next five years, LPI(LP Information) projects that Sodium Fluorosilicate will register a 8.9% CAGR in terms of revenue, reach US\$ 220 million by 2023, from US\$

130 million in 2017.
