In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Structural Hollow Sections market for 2018-2023.

A structural hollow section is a type of metal profile with a hollow tubular cross section. The term is used predominantly in the United States, or other countries which follow US construction or engineering terminology.

Structural Hollow Sections especially rectangular sections, are commonly used in welded steel frames where members experience loading in multiple directions. Square and circular HSS have very efficient shapes for this multiple-axis loading as they have uniform geometry along two or more cross-sectional axes, and thus uniform strength characteristics. This makes them good choices for columns. They also have excellent resistance to torsion.

Over the next five years, LPI(LP Information) projects that Structural Hollow Sections will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
