The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Titanium Dental Implants market for 2018-2023.

A dental implant is a surgical component that interfaces with the bone of the jaw or skull to support a dental prosthesis such as a crown, bridge, denture, facial prosthesis or to act as an orthodontic anchor. The basis for modern dental implants is a biologic process called osseointegration, in which materials such as titanium form an intimate bond to bone. The implant fixture is first placed so that it is likely to osseointegrate, then a dental prosthetic is added. A variable amount of healing time is required for osseointegration before either the dental prosthetic (a tooth, bridge or denture) is attached to the implant or an abutment is placed which will hold a dental prosthetic.

Europe is the largest supplier and consumption market of Dental Implants, with a production market share 38.8% and sales market share nearly 45.9% in 2016. The second place is North America; following Europe with the production market share of 36.7% and the sales market share over 26%.

The industrial price of dental implants was deflated slowly in the last years. The global average price is 233 USD/Unit in 2017. The key materials are titanium, and the price of the materials is relatively stable. The gross margin was deflated slowly in the last years. In the 2017, the global average gross margin was 74%.

Over the next five years, LPI(LP Information) projects that Titanium Dental Implants will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
