Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Titanium Sputtering Target market for 2018-2023.

Titanium Sputtering Target is a material that is used to create thin films in a technique known as sputter deposition, or thin film deposition. During this process the titanium, which begins as a solid, is broken up by gaseous ions into tiny particles that form a spray and coat another material, which is known as the substrate. Sputter deposition is commonly involved in the creation of semiconductors and computer chips.

First, for industry structure analysis, the Titanium Sputtering Target industry is relatively concentrated. These manufacturers range from large multinational corporations to small privately owned companies compete in this industry. The top five producers account for about 58 % of the revenue market. Regionally, Japan is the biggest production value area of valves, also the leader in the whole Titanium Sputtering Target industry.

Second, Japan occupied 34.12% of the production market in 2016. It is followed by North America and China, which respectively account for around 24.17% and 15.01% of the global total industry. Other countries have a smaller amount of production.

Geographically, North America was the largest consumption market in the world, which took about 27.70% of the global consumption volume in 2016.

Third, for price trend analysis, a key variable in the performance of Titanium Sputtering Target producers is raw material costs, specifically the speed at which any increase can be passed through to customers.

Over the next five years, LPI(LP Information) projects that Titanium Sputtering Target will register a 5.9% CAGR in terms of revenue, reach US\$ 250 million by 2023, from

US\$ 180 million in 2017.
