The lighting system of vehicles consists of lighting and signaling devices mounted or integrated to the front, rear, sides, and in some cases the top of a motor vehicle. The lighting system consists of lighting and signaling devices mounted or integrated to the front, rear, sides, and in some cases the top of a motor vehicle. This lights the roadway for the driver and increases the visibility of the vehicle, allowing other drivers and pedestrians to see a vehicle's presence, position, size, direction of travel, and the driver's intentions regarding direction and speed of travel. Emergency vehicles usually carry distinctive lighting equipment to warn drivers and indicate priority of movement in traffic.

On the basis of technology, the market is segregated into halogen, xenon, and LED. Halogen dominated the industry in 2017 and is expected to grow at a CAGR of over 4.2% from 2017 to 2023. Low purchasing & replacement cost and easy availability are few factors for the adoption of halogen technology. They are available in different dimensions and are cost-effective and easy to replace. However, excessive heat loss while light radiation has increased awareness for energy efficiency leading to the reduced usage of halogen. LED lighting market accounted for over 10% of the overall share in 2017 and is expected to witness substantial growth over the forecast period. This is largely attributed to red LED applications such as indicators and brake lights. Over the next five years, LPI(LP Information) projects that Vehicles Front Light will register a 4.8% CAGR in terms of revenue, reach US\$ 8860 million by 2023, from US\$ 6690 million in 2017.
