Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The clown fish (also known as the anemonefish) is a small species of fish that is found around tropical coral reefs. The most commonly known species of clown fish is orange with white markings but clown fish can be found in many different colours and can also differ in shape.

The clown fish seen in the market include wild type and captive bred type. For the moment, wild type is kept at the amount of 1 million Pcs, which mainly lives in the Southeast Asian region. Considering the various factors, such as environmental issues, the wild clown fish is estimated to reduce in the market while the captive bred type is increasing.

Clown fish, or anemone fish as they are sometimes known, belong to the Damselfish family that includes sergeant majors and chromids. There are 28 species in the world, they are generally small in size (the largest species attaining 16cm maximum in length), and usually have some orange coloration on their bodies. The most famous, and most sought after, species is the clown anemone fish, *Amphiprion percula*, which has three white bars narrowly edged in black across their bodies. They are generally shallower water dwellers, existing in the top 15-20m of the world's oceans, and are opportunistic planktivores.

Over the next five years, LPI(LP Information) projects that Clown Fish will register a 6.0% CAGR in terms of revenue, reach US\$ 110 million by 2023, from US\$ 78 million in 2017.
