Electronic sphygmomanometer is a device used to measure blood pressure, composed of an inflatable cuff to collapse and then release the artery under the cuff in a controlled manner, and a mercury or mechanical manometer to measure the pressure. It is always used in conjunction with a means to determine at what pressure blood flow is just starting, and at what pressure it is unimpeded. Manual sphygmomanometers are used in conjunction with a stethoscope.

The Electronic Sphygmomanometers industry concentration is relatively high; there are many big manufacturers in the world, and above 70% of the production are produced in China.

Company mergers and acquisitions, and inter-companies cooperation have occurred for development and growth. As the downstream consumption usually follows with developed and rapid economic growth areas, such as BRICS, the giant companies prefer educating the market of them.

Over the next five years, LPI(LP Information) projects that Electronic Sphygmomanometer will register a 7.2% CAGR in terms of revenue, reach US\$ 2720 million by 2023, from US\$ 1790 million in 2017.
