Ethyleneamines are a class of amine compounds containing ethylene (-CH₂CH₂-) linkages between amine groups. These compounds are generally colorless, low-viscosity liquids with a fishy amine odor.

In consumption market, the growth rate of global consumption is smooth. China and USA are still the mainly consumption regions due to the demand in the downstream and rapid development of economy.

Currently, There are two main routes for the production of ethyleneamines, the reaction between ethylene dichloride and ammonia. In the ethylene dichloride route, the initial product of this reaction is ethylenediamine. In the monoethanolamine route, monoethanolamine reacts with ammonia, catalyzed by transition metal catalysts.

We tend to believe this industry is a mature industry, and the consumption increasing degree will show a smooth growth curve. For product prices, the slow downward trend in recent years will maintain in the future as competition intensifies. Besides, prices gap between different brands will go narrowing gradually. Also, there will be fluctuation in gross margin.

Over the next five years, LPI(LP Information) projects that Ethyleneamines will register a 0.9% CAGR in terms of revenue, reach US\$ 1620 million by 2023, from US\$ 1540 million in 2017.
