A sprinkler head has a two-part metal element that is fused by a heat-sensitive alloy. The link holds the pip cap, or plug, in place. Once the ambient temperature around the sprinkler head reaches a specified temperature, the alloy releases and the metal elements separate, which causes the pip cap to fall away. Water is then released.

The main consumption regions are concentrated in the Asia, Europe and North American. The fire sprinkler heads consumption has great relationship with the local economical developed level and currently, the developing countries' grow rate has overcome the developed countries.

China is currently carrying out a large number of urban new construction and renovation projects. What is more, Chinese government has stepped up public fire safety strategy and published a series of statutory provisions, such as GB5135.1-2003.

So, China's market still has great potential in the future.

There are thousands of players in China, and the market is very fragmented. Compared with the prices abroad, the prices of local products in China are much lower.

The import and export volume is relative small, China has very large export ratio.

Currently, the Fire door has none of anti-dumping phenomenon.

In the future, the Fire door will have a good future; the price fluctuation has relationship with the raw material and the anti-fire degree. The technology will more mature and the industry is more dispersion. The installation rate of fire door is becoming more and more.

Over the next five years, LPI(LP Information) projects that Fire Sprinkler Heads will register a 1.9% CAGR in terms of revenue, reach US\$ 750 million by 2023, from US\$ 670 million in 2017.
