Inductive Position Sensors are devices which generates output signal or electrical signal when metal objects are either inside or entering into its sensing area from any direction. The metal objects above includes iron, aluminum, brass, copper, etc with varied sensing distances. First inductive position sensor was introduced in the mid 60's.

In the next five years, the global consumption of Inductive Position Sensors will maintain a 6%-8% annual growth rate, consumption is expected to beyond 21000 K units in 2020, the average operating rate will remain at 80% to 90%.

Demand is driven by demographics and the health of the economy. The profitability of individual companies depends on their ability to bid accurately, secure contracts, and control costs. Large companies enjoy economies of scale in financing and the ability to offer a broad range of services in many locations. Smaller companies can compete effectively by specializing in particular services or focusing on certain geography.

Over the next five years, LPI(LP Information) projects that Inductive Position Sensors will register a 2.5% CAGR in terms of revenue, reach US\$ 940 million by 2023, from US\$ 820 million in 2017.
