Abstracts

The global 3D Structured Light Type Sensor Module market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The principle of the 3D structured light scheme is to use an infrared light source. The emitted light is projected onto the object through a certain code. When these patterns are reflected back from the object surface, different deformations will occur with different distances from the object. The image sensor will take pictures of the deformed patterns. Based on the triangulation method, the corresponding parallax can be obtained by calculating the deformation amount of each pixel in the captured pattern, so as to further obtain the depth value.
