The global Active Phased Array TR Module market size is predicted to grow from US$ 5095 million in 2025 to US$ 12080 million in 2032; it is expected to grow at a CAGR of 13.4% from 2026 to 2032.

T/R module is a functional module used in radar or communication systems to receive and transmit electromagnetic wave signals of a certain frequency, and to perform amplitude and phase control within the working bandwidth. It is an active phased array radar that implements beam electronic control scanning, signal transmission and reception. The core component of amplification is the core of phased array radar and accounts for a high proportion of the cost of phased array radar. It is mainly used to amplify transmitting and receiving signals, as well as control signal amplitude and phase. The T/R module consists of a low-noise amplifier, a power amplifier, a limiter, a phase shifter, etc., and is widely used in precision guidance and radar detection and other fields.

Active phased array radar T/R module (i.e. transceiver module) is the core component of active phased array radar. It is located at the RF front end of the active subarray of the phased array radar. It mainly includes two channels of transceiver and transceiver, which complete the final power amplification of the transmitted signal to the array element and the previous amplification of the received signal, and realize the functions of amplitude and phase correction of the array surface and beam scanning.
