Afatinib dimaleate tablets are oral, small-molecule, irreversible tyrosine kinase inhibitors (TKIs) primarily used for treating patients with non-small cell lung cancer (NSCLC) harboring epidermal growth factor receptor (EGFR) mutations. Afatinib irreversibly inhibits EGFR, HER2, and HER4 signaling pathways, preventing cancer cell growth and proliferation. Clinical studies have shown that afatinib is highly effective as a first-line treatment for EGFR-mutant NSCLC, particularly in patients with Del19 and L858R mutations. The medication is typically administered orally once daily, with dosage adjustments based on individual patient conditions. Common side effects include diarrhea, skin rash, and stomatitis, and the drug should be used under medical supervision.
