## Abstracts

The global AI Biomedicine Service market size is predicted to grow from US\$ 4043 million in 2025 to US\$ 7549 million in 2032; it is expected to grow at a CAGR of 9.4% from 2026 to 2032.

AI biomedicine service represents the deep application of artificial intelligence technology in the biomedical field, aiming to accelerate new drug development, optimize disease diagnosis and treatment plans through advanced technologies such as big data analysis and machine learning. This service encompasses multiple aspects, from drug discovery and clinical trial design to patient management, significantly improving the efficiency and accuracy of biomedical research and development. By deeply mining massive medical data, ai can identify potential biomarkers, predict disease progression, and provide personalized treatment plans for patients. Additionally, ai assists doctors in diagnosing complex diseases, reducing misdiagnosis rates, and enhancing the quality of medical services. With continuous technological advancements, ai biomedicine service is gradually transforming the landscape of the biomedical industry, bringing more health benefits to patients.

From a multi-dimensional classification and parameterization perspective, the market can be segmented by service focus (AI drug discovery, AI antibody/biologic discovery, AI pathology and biomarker services, AI omics analytics), by delivery model (platform-as-a-service, fee-for-service, co-development partnerships, or risk-sharing milestone models), and by data modality (chemical structures, protein structures, imaging pathology data, genomics, transcriptomics, and multi-omics). Key performance parameters used by customers include hit identification success rates, lead optimization cycles, reduction in wet-lab iterations, model generalizability across targets, and the ability to integrate proprietary datasets securely.

The industry value chain begins upstream with data generation sources such as high-throughput screening labs, biobanks, sequencing providers, and pathology laboratories, alongside cloud and computing infrastructure suppliers. Midstream players are AI Biomedicine Service providers that combine proprietary algorithms, curated datasets, and domain expertise to deliver discovery or analysis services. Downstream customers include pharmaceutical companies, biotech startups, and, increasingly, CROs and CDMOs integrating AI into their service portfolios. Strategic partnerships and long-term collaborations are common, often embedding AI services deeply into clients' R&D workflows.

From a profitability perspective, AI Biomedicine Services generally exhibit attractive gross margins, typically in the 60–80% range, reflecting their software- and data-driven nature. Margins vary by model: platform subscriptions and recurring service contracts achieve higher margins, while project-based discovery services see lower margins due to scientific labor and validation costs. Market momentum is driven by rising R&D costs, pressure to improve pipeline productivity, and growing acceptance of AI-derived insights by regulators and pharma partners. Key trends include consolidation between AI platforms and CROs, expansion from discovery into preclinical and translational stages, and increasing use of outcome-linked and co-development revenue models.
