Alcohol Ignition Interlocks, also known as 'alcohol-sensitive ignition interlock devices,' are devices installed in a car's ignition system to prevent drivers from starting the car if their blood alcohol concentration exceeds the safe limit. This device is designed to prevent repeat offenses by individuals with a history of drunk driving. The alcohol ignition interlock requires the driver to take a breathalyzer test before starting the car. If the test result exceeds the safe level, the control box within the alcohol interlock sends a signal to the vehicle, preventing it from starting. In 2025, global production of Alcohol Ignition Interlocks reached 3.388 million units, with an average selling price of US\$357.14 per unit and a gross profit margin of approximately 20%. Major global production capacity is concentrated in North America and Europe (where strict regulations drive large-scale production and services), while production capacity and installation scale in the Asia-Pacific and Latin American markets are gradually increasing to meet rising road safety requirements.
