## Abstracts

The global Algae Online Monitor market size is predicted to grow from US\$ 182 million in 2025 to US\$ 314 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

An online algae monitor is a water quality analysis instrument used for continuous, real-time monitoring of algae concentration and trends in water bodies. It typically uses principles based on chlorophyll a fluorescence, phycocyanin/phycoerythrin optical signals, or multi-parameter spectral analysis to quantify algal biomass online. The device generally consists of an underwater sensor probe, a signal processing and calibration unit, and a data transmission and alarm system. It can achieve all-weather automatic monitoring and connect the data to water management platforms or environmental monitoring systems. Online algae monitors are widely used in drinking water sources, reservoirs, lakes, river sections, and aquaculture water bodies, and are key monitoring equipment for algal bloom early warning, water quality risk control, and aquatic ecological management. In 2025, sales reached 410,000 units, with an average price of \$425, total production capacity of 500,000 units, and a gross profit margin of 35%.

The market demand for online algae monitoring instruments is not simply due to the increase in the number of monitoring points, but more so to the upgrading of water environment management models. The shortcomings of traditional manual sampling + laboratory analysis in terms of timeliness and continuity make it difficult to cope with the risk of sudden algal blooms, especially in drinking water sources and large reservoirs where risk tolerance continues to decline. Online monitoring equipment can generate high-frequency, continuous data streams, providing an early warning window for algal outbreaks, gradually upgrading it from a 'scientific research and auxiliary monitoring tool' to a basic risk management device for water and environmental protection departments. This change in positioning supports stable demand in the medium to long

term.

Currently, online algae monitoring instruments exhibit clear technological stratification: single chlorophyll a monitoring is more used for trend judgment and cost-sensitive scenarios, while systems incorporating multi-channel fluorescence, algae species differentiation, or linkage with nutrient parameters are more favored by high-standard water sources and regulatory projects. As users demand higher false alarm rates, improved interference resistance (turbidity, organic matter), and long-term stability, high-end products command stronger pricing power. The future market will exhibit a structure of 'wide coverage at the low end and strong regulation at the high end,' with vendor competition focusing on algorithm correction, long-term maintenance capabilities, and system integration levels.
