The global Aluminium Air Battery market size is predicted to grow from US\$ 576 million in 2025 to US\$ 1710 million in 2032; it is expected to grow at a CAGR of 17.1% from 2026 to 2032.

An aluminium–air battery is a metal–air electrochemical system that uses aluminium as the anode and oxygen from ambient air as the cathode reactant, producing electricity through aluminium oxidation. It offers extremely high theoretical energy density and is widely explored for backup power systems, military devices, unmanned platforms, micro-mobility vehicles and emerging long-range EV range-extender concepts. In 2024, the global average system price is approximately US\$260 per unit, with worldwide shipments reaching around 1.95 million units. Gross margins typically range between 25%–40%, depending on aluminium anode quality, catalyst formulation, membrane durability and system engineering. The supply chain includes upstream aluminium plates, catalysts, electrolytes and separators; midstream companies conduct system design, module assembly, casing, safety validation and performance tuning; downstream customers include micro-mobility manufacturers, backup-power solution providers, UAV/robotics integrators and early-stage EV developers.

The aluminium–air battery market is entering early commercial acceleration as its high energy density and low cost of aluminium make it attractive for micro-mobility, emergency backup and military applications. The technology is not a direct competitor to lithium-ion for rechargeable use, but its replaceable aluminium-plate model works well in scenarios requiring long endurance and infrequent cycling. With improvements in catalysts and membranes, aluminium–air is expected to expand into hybrid EV range-extension and distributed energy storage, supporting a strong double-digit growth trajectory to 2031.
