The global Aqueous Battery market size is predicted to grow from US\$ 326 million in 2025 to US\$ 1604 million in 2032; it is expected to grow at a CAGR of 26.1% from 2026 to 2032.

Aqueous batteries use concentrated brine solutions as electrolytes to facilitate the transfer of ions between electrodes and induce electrical current. Compared to non-aqueous batteries, aqueous batteries are not flammable and do not pose any significant risk of explosion due to the water-based nature of their electrolytes. They are also free of the toxic chemicals and environmental risks associated with their non-aqueous counterparts.

Amidst the urgent global necessity to move away from fossil fuels, renewable energy sources like solar and wind power are becoming more common. In this environment, where sustainable energy storage technologies are constantly evolving, companies are relentlessly seeking efficient and eco-friendly solutions. Therefore, a promising new solution that has emerged is aqueous batteries. Battery storage systems such as lithium-ion batteries play a crucial role in mitigating the intermittency of renewable energy sources like solar and wind power. For instance, they store surplus energy during periods of high generation and release it during times of high demand or low generation, ensuring a stable power supply. Aqueous batteries are expected to solve safety issues of power batteries. Current energy density is relatively low with only at 75Wh/kg, however, in the future, new nanomaterials are planned to be applied to electrodes to increase energy density. It is anticipated that within the next 10 years, they could replace a portion of lithium-ion batteries. However, due to the relatively low energy density, further performance improvements are necessary to meet the demand for high-energy-density batteries in automotive and other fields.
