Automatic Staining and Sealing Machine is an important instrument used in cytological research in the medical field. It stains and seals cell specimens through a series of automated steps to observe cell structure and morphological changes. This equipment usually includes a liquid supply system, a liquid discharge system, a turntable system, a heating system, a control system and an operating interface. The automation technology of the automatic staining and sealing machine makes the staining and sealing process more efficient, accurate and reliable, providing important technical support for cytological research.

Pathological diagnosis is made by pathologists by observing the tissue structure, cell morphology, color reaction, etc. of clinical samples (such as human tissue obtained by surgical resection, puncture, etc.). Pathological diagnosis is currently the most accurate diagnostic method. It is usually used as the final diagnosis for most diseases, especially cancer, and is of decisive significance for disease diagnosis, selection of treatment plans, and prognosis. The fully automatic staining and sealing machine is one of the key equipment in the pathological diagnosis industry. It has the characteristics of high technical level and multidisciplinary intersection. It is a typical technology-driven industry and one of the most active fields for the application of cutting-edge technologies in
