## Abstracts

The global Automotive CTB Solutions market size is predicted to grow from US\$ 339 million in 2025 to US\$ 1329 million in 2032; it is expected to grow at a CAGR of 22.4% from 2026 to 2032.

Automotive CTB Solutions are a technology that directly embeds battery cells into the vehicle body structure. By eliminating the traditional battery pack module and cover, the battery system simultaneously serves as both an energy carrier and structural support, forming an integrated 'battery as body' architecture. CTB technology involves deep integration of the battery and the vehicle body, resulting in high R&D and manufacturing costs. However, large-scale application can reduce costs by decreasing the number of components and improving production efficiency. The industry's gross profit margin is influenced by technological maturity, supply chain integration capabilities, and market competition. Leading companies typically maintain a gross profit margin of 25%-35%, while some technology leaders can achieve over 40% due to patent barriers and brand premiums.

Market drivers primarily include:

Forced Policy and Standard Upgrades:

Many countries globally have introduced safety regulations for new energy vehicles, requiring battery systems to pass stringent tests such as needle penetration and compression, forcing companies to adopt highly integrated technologies like CTB (Carbon-to-Battery) to improve safety. Simultaneously, carbon emission policies are accelerating the phasing out of gasoline-powered vehicles, creating market space for CTB models.

## Upgraded Consumer Demands and Expanded Scenarios:

User demands for range, safety, and space drive technological iteration. For example, CTB models free up cabin space by reducing battery pack thickness (e.g., BYD's Seal battery pack is only 110mm thick), meeting the needs of family travel; high-strength structures (e.g., BYD's CTB body torsional stiffness reaches 40,500 N·m/°) improve handling, attracting younger consumers.

Technological iteration and ecosystem synergy: CTB is integrated with technologies such as the 800V high-voltage platform and CTC (Battery Chassis Integration) to form an integrated 'structure-electrical-thermal management' solution. For example, BYD plans to launch CTB 2.0, integrating cooling pipes to the battery tray to improve fast charging efficiency; Tesla combines CTB with integrated die-casting technology to reduce the number of parts by 370, lowering manufacturing costs. Furthermore, a well-developed battery recycling system reduces the total lifecycle cost, promoting the large-scale application of CTB technology.
