Abstracts

The global Automotive Ternary Lithium Battery Recycling market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

There are many kinds of cathode materials for lithium ion batteries, mainly including lithium cobalate, lithium manganate, lithium nickel oxide, ternary materials, lithium iron phosphate, etc. The ternary polymer lithium battery refers to the lithium battery whose cathode materials are lithium nickel cobalt manganese or lithium nickel cobalt aluminate ternary cathode materials. This report studies the recycling of ternary lithium batteries for automotives.

With the rapid growth of market share in ternary lithium-ion batteries, retired ternary lithium-ion batteries have also experienced explosive growth. Therefore, recycling electrode materials for ternary lithium-ion batteries has become a new hot topic in the battery industry. Due to its high material cost, poor stability, and short cycle life, ternary batteries are more suitable for direct disassembly and recycling. Secondly, the development of ternary battery starts later than that of Lithium iron phosphate, and the recovery rate will also slightly lag behind that of Lithium iron phosphate. After the retirement of Lithium iron phosphate power batteries, it is more suitable for cascade utilization. However, the current cascade utilization has not yet achieved technical breakthrough, and it is difficult to form large-scale and commercialized. It is expected that the recycling market space of ternary lithium batteries will continue to lead in the medium and short term.
