The global Carbon Dioxide Pipeline Transport Service market size is predicted to grow from US\$ 4770 million in 2025 to US\$ 7764 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

Carbon Dioxide Pipeline Transport Service involves the movement of captured CO₂ from industrial or energy production sites to storage locations or for utilization in applications like Enhanced Oil Recovery (EOR). CO₂ is typically compressed into a dense liquid form and transported via pipelines to reduce its volume, making it easier and more economical to transport over long distances.

The CO₂ pipeline transport sector is expected to expand significantly as global carbon capture, utilization, and storage (CCUS) deployment accelerates, driven by climate policy targets, industrial decarbonization mandates, and commercial utilization pathways such as enhanced oil recovery (EOR) and permanent geological storage. Future development will see increased investment in network expansion to connect dispersed industrial CO₂ sources with shared trunk lines and storage hubs, improving economies of scale and reducing per-ton transport costs. Regulatory frameworks and carbon pricing mechanisms will further support long-distance transport infrastructure, while technological advancements in pipeline materials and monitoring systems will enhance the safety, reliability, and cost-effectiveness of CO₂ transmission. Cross-border and interregional pipeline linkages are also likely to emerge, enabling greater flexibility in sequestration options and fostering regional CO₂ markets. As infrastructure matures, integrated service models encompassing capture, transport, and storage will become more prevalent, facilitating more predictable cash flows and reducing risk for investors and industrial participants.
