The global Chip-type Solid-state Capacitor market size is predicted to grow from US\$ 273 million in 2025 to US\$ 350 million in 2032; it is expected to grow at a CAGR of 3.6% from 2026 to 2032.

In 2025, global chip-type solid-state capacitor production reached approximately 19 m units, the average price is 15 usd/unit. A chip-type solid-state capacitor is an electronic component that stores electric charge by sandwiching a dielectric material between two electrodes. They are widely used in various electronic devices and circuits for various circuit applications.

Market Concentration and Key Players:

Internationally, chip-type solid-state capacitors have a high degree of market concentration, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as TDK Corporation and Panasonic Corporation; domestically, manufacturers of chip-type solid-state capacitors include Aihua Group.

Manufacturing Processes and Market Trends:

The manufacturing process of patch type solid capacitor begins with etching and chemical treatment of high purity aluminum foil to form dielectric layer, and then anode foil cathode foil and electrolytic paper are wound into core package. The core process is to adopt conductive polymer as solid electrolyte, impregnate monomer and oxidant, and make core package polymerize in specific temperature range gradient, during which multiple cleaning and heat treatment are needed to remove by-products and improve

performance, and finally package and mold through injection molding process. This process results in low equivalent series resistance, high stability and long life.

At the market level, the demand for SMD solid-state capacitors is strongly driven by the expansion of consumer electronics, automotive electronics, industrial control and communication equipment, and its market size continues to grow. Future technology evolution focuses on higher performance and smaller volume, improving capacity density and frequency characteristics by developing new conductive polymer materials and optimizing stack structures. At the same time, high reliability in high temperature environments and stability to withstand multiple reflows have become the key to meeting the demanding requirements of industrial automation and automotive electronics. The application of intelligent manufacturing technology will also further optimize production efficiency and product consistency, and promote the continuous development of the industry.
