The global CO₂ Transport Solution market size is predicted to grow from US\$ 10779 million in 2025 to US\$ 19165 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

Carbon dioxide (CO₂) transportation involves the movement of captured CO₂ from its source—such as industrial plants, power stations, or direct air capture facilities—to storage sites or utilization points. The primary methods of CO₂ transportation include pipelines, ships, rail, and trucks, with pipelines being the most common and cost-effective for large-scale and long-distance transport, especially in carbon capture and storage (CCS) projects. Pipelines transport CO₂ in gaseous, liquid, or supercritical states, depending on pressure and distance requirements, to ensure efficient flow and minimize costs.

Carbon dioxide transportation is evolving from isolated, project-specific solutions into a scalable, networked infrastructure that supports large-scale CCUS deployment and industrial decarbonization. Future development will emphasize multi-modal transport systems combining pipelines, shipping, rail, and road logistics to match different distances, volumes, and regional conditions, while hub-and-spoke structures will become the dominant configuration for aggregating dispersed CO₂ sources and connecting them to utilization or storage sites. CO₂ shipping is expected to play an increasingly important role in cross-regional and cross-border transport, particularly in regions with offshore storage potential, and transportation services will be increasingly integrated with capture and storage offerings into end-to-end CCUS solutions. Supported by climate policies, carbon pricing mechanisms, and government-backed infrastructure programs, CO₂ transportation is likely to transition into a strategic, quasi-public infrastructure segment with stable long-term demand and investment appeal.
