Colour Confocal Displacement Sensors, also known as confocal chromatic sensors, are a type of sensing technology used for precise measurements of surface distances or displacements. They operate based on the principle of chromatic aberration, utilizing the variations in wavelength and color to determine the distance between the sensor and the target surface. Colour confocal displacement sensors are highly accurate and capable of measuring distances in the sub-micrometer range. They are widely used in industries such as manufacturing, metrology, quality control, and automation for applications like thickness measurement, surface profiling, and position monitoring.

United States market for Colour Confocal Displacement Sensors is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Colour Confocal Displacement Sensors is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
