The global Contactless Inductive Charging market size is predicted to grow from US$ 9190 million in 2025 to US$ 56770 million in 2032; it is expected to grow at a CAGR of 30.3% from 2026 to 2032.

Non-contact inductive charging is a convenient, efficient and safe charging method, which uses the principle of electromagnetic induction to establish a magnetic field between the charger and the device to transmit energy. Usually, the charger generates an alternating magnetic field through an induction coil, and then the induction coil inside the device receives the magnetic field and converts the energy into electrical energy, thereby realizing charging. This charging method does not need to plug and unplug the charging cable, just place the device on the charger to automatically charge, which greatly improves the convenience and comfort of charging. As technology advances, the efficiency of contactless inductive charging will continue to improve. At present, compared with wired charging, the efficiency of non-contact inductive charging is still lost, but the future development trend will be to continuously improve charging efficiency and reduce energy loss.
