The global CPP Composite Film market size is predicted to grow from US$ 5944 million in 2025 to US$ 7318 million in 2031; it is expected to grow at a CAGR of 3.5% from 2025 to 2031.

CPP composite film is a polypropylene film produced by extrusion casting process. This type of film is different from BOPP film and belongs to non oriented film. It has the characteristics of good transparency, high glossiness, good stiffness, good moisture resistance, excellent heat resistance, and easy heat sealing. After printing and bag making, it is suitable for clothing, knitwear, and flower packaging bags, document and photo album films, food packaging, and metalized films for barrier packaging and decoration. In addition, there is an increasing demand for food packaging, candy packaging, pharmaceutical packaging, adhesive tapes, business card holders, circular folders, and other related products.

CPP composite film is a composite thin film formed by two or more layers, which must be inseparable like a thin film. This not only involves the adhesive between two films It is also related to the ink film. Adhesives are synthetic products. Most adhesives are two-component polyurethane (PU) adhesives The chemical reaction during the drilling process solidifies the adhesive. The adhesive on the surface of the substrate is mainly a physical process, with only a small part being a chemical process. At this time, the components of the adhesive blend with those in the plastic film and further solidify. If a film has already been printed during the bonding process, the adhesive and ink must meet more requirements. The most basic requirement is that the inner layer before composite should have good adhesion and thorough drying. This is becoming more and more flavorful No solvent residue is allowed in the printed inner film. But solvents or alcohol often remain in the ink connecting material. For this reason, the performance of the adhesive must be able to bind with free radicals (- OH groups). Otherwise, the adhesive and curing agent will undergo a self bonding reaction and lose their intended

cat like properties. For example, during the composite process, the film has already been printed with PVB ink, and there are residual isomers in the ink. The chemical group (NCO group) of this salt will react with the free radical OH of alcohol and water. The absence of residue prevents the adhesive from fully reacting. Subsequently, there was a lack of solidification and drilling force. There is a difference between solvent based adhesives and solvent-free drilling agents such as UV adhesives in drilling agents. Solvent based drilling agents require a drying oven to evaporate the solvent. When using UV adhesive, UV light passes through the film and reaches the adhesive, causing the adhesive to polymerize together. At present, composite film preparation technology is also used in the preparation of some inorganic non-metallic thin films, achieving an improvement in the overall optoelectronic performance.
