The global Current Memristors market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A current memristor is a passive electronic component. Like a resistor, a memristor can generate and maintain a safe current through a device. But unlike resistors, memristors can 'remember' the amount of charge that passed through them even after the power is turned off. Two sets of memristors are more capable of performing the same functions as transistors, but on a smaller scale.
