The global Electron Laser Quantum Computers market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Electron laser quantum computers (ELQCs) are a type of quantum computer that uses the coherent interaction of electrons with electromagnetic fields in a laser to manipulate and store quantum information. Unlike classical computers, which operate on bits that can be in a state of 0 or 1, quantum computers use quantum bits, or qubits, which can exist in multiple states simultaneously.

ELQCs use a process called quantum interference to manipulate qubits, which involves the controlled interaction of electrons with laser beams to generate coherent states that can be used to encode and process information. This allows ELQCs to perform certain types of computations much faster than classical computers.

One of the advantages of ELQCs is their potential scalability, as they can be built using existing semiconductor fabrication technologies. Additionally, they can operate at room temperature, which makes them more practical for use in everyday applications.

United States market for Electron Laser Quantum Computers is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
