Fluorescence preclinical imaging system is a specialized imaging device used in preclinical research to visualize and study biological processes in living animals, typically small animals like mice, rats, and other rodents. The system utilizes fluorescence imaging technology to detect and analyze fluorescent signals emitted by specific biomarkers or fluorescent probes introduced into the animal"s body. This non-invasive imaging technique allows researchers to monitor and understand various biological processes in real-time, providing valuable insights for drug development, disease modeling, and other preclinical studies.

The global market for fluorescence preclinical imaging systems has been witnessing significant growth, driven by the increasing adoption of preclinical research in the pharmaceutical, biotechnology, and academic sectors. These imaging systems have become essential tools in studying disease models, drug efficacy, and the underlying biological processes in small animals, providing valuable data for drug development and translational research. North America, particularly the United States, has been a dominant market for fluorescence preclinical imaging systems due to its strong pharmaceutical and biotechnology research infrastructure. Europe and Asia-Pacific have also seen significant growth in the adoption of these systems, driven by increasing research activities and investments in life sciences. The global market for fluorescence preclinical imaging systems is expected to continue growing in the coming years. Advancements in imaging technology, including the development of new fluorescent probes and biomarkers, will likely drive the demand for these systems. Moreover, the
