The global 1-Adamantanol market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

1-Adamantanol is a white crystalline powder, an organic compound belonging to the adamantane-derived tertiary alcohols. It is insoluble in water but soluble in organic solvents and sublimes easily. This substance is an important basic raw material for the synthesis of high-value adamantane derivatives, pharmaceutical intermediates (such as adapalene), and special materials.

The main raw material for the production of 1-adamantanol is adamantane. 1-Adamantanol can be directly produced by oxidizing adamantane with an oxidizing agent (such as nitric acid, potassium permanganate, or other oxidation systems). This process usually requires a solvent and is mainly used in the production of pharmaceutical intermediates such as adapalene and 1-adamantaneacetic acid.

In 2025, global sales are projected to be approximately 5,000 tons, with an average market price of around $2,210 per ton. The industry's gross profit margin is expected to be in the range of 15%–25%.

The demand for high-end pharmaceutical intermediates is the main driving force behind the 1-adamantanol industry. 1-adamantanol is a key precursor in the synthesis of various adamantane-based drugs, which are irreplaceable in the treatment of central nervous system diseases such as antiviral infections, Alzheimer's disease, and Parkinson's disease due to the high penetration ability conferred by the adamantane skeleton. With the development of an aging society, the market for these drugs is steadily increasing. Furthermore, the evolution of synthesis processes towards greener and more efficient methods (such as biocatalysis) is also an important driving force for technological progress. At the same time, the industry faces various pressures,

including environmental concerns.
