The 10–35kV indoor current transformer is a measurement and protection device used in medium and high voltage AC power systems. Its core function is to convert the large current in the primary system into a standard small current (such as 5A or 1A) at a fixed ratio so that it can be connected to power metering, relay protection and automatic monitoring equipment, thereby realizing accurate monitoring and safe control of the power system. This type of transformer usually adopts epoxy resin casting or dry insulation structure, with excellent insulation performance, moisture and heat resistance and mechanical strength, and is suitable for systems with rated voltage levels of 10kV, 20kV or 35kV. It is one of the key basic components in the power secondary system. With the development of power grid intelligence and distribution automation, the 10–35kV indoor current transformer has been continuously optimized in terms of accurate measurement, high safety and structural modularity, and has become an indispensable core equipment in the medium and high voltage distribution link.
