The global 10-DAB III market size is predicted to grow from US\$ 77.28 million in 2025 to US\$ 150 million in 2032; it is expected to grow at a CAGR of 10.1% from 2026 to 2032.

10-DAB III, full name 10-Deacetylbaccatin III, is a natural tetracyclic diterpenoid taxane extracted from *Taxus* twigs and leaves. It appears as off-white crystalline powder, poorly soluble in water but soluble in common organic solvents. As a core pharmaceutical intermediate, it is the key starting material for semi-synthesis of Paclitaxel, Docetaxel and Cabazitaxel, three mainstream anti-cancer APIs. Besides bulk drug manufacturing, it is also widely applied in novel taxane derivative research and pharmaceutical reference standard preparation. The price of pharmaceutical-grade 10-DAB III (>98% HPLC) fluctuates between 1800-3200 US dollars per kilogram, affected by raw material yield, extraction cost and global market demand. Its industrial chain starts from *Taxus* cultivation and raw leaf harvesting in China and India, followed by plant extraction, purification and fine refinement at professional manufacturers including South Pharmaceutical, Alchem and Yunnan Hande. After finished intermediate production, 10-DAB III is globally traded to pharmaceutical factories for semi-synthesis of Paclitaxel, Docetaxel and Cabazitaxel bulk drugs. Downstream finished anticancer medicines are then processed into injections for worldwide clinical use. Emerging R&D demand for taxane ADC drugs also steadily lifts long-term market consumption of this core intermediate.

Market Driving Factors

Sustained clinical demand for anti-cancer medicines

Paclitaxel, Docetaxel and Cabazitaxel remain essential first-line chemotherapy drugs for multiple malignant tumors worldwide. Stable global sales of finished anticancer drugs create steady basic procurement demand for 10-DAB III as their core semi-synthetic

intermediate.

Advancing development of novel taxane derivatives and ADC drugs

Growing R&D investment in antibody-drug conjugates and innovative taxane anti-tumor agents expands downstream application scenarios, generating incremental consumption of high-purity 10-DAB III.

Expansion of mature generic drug market globally

Mass approval of generic versions of paclitaxel-series APIs in emerging pharmaceutical markets boosts bulk purchase of standard-grade 10-DAB III and fuels overall market volume growth.

Advantages of plant extraction industrialization in China and India

Large-scale Taxus planting and mature extraction & purification technologies in China and India guarantee stable raw material supply, lower comprehensive production cost and promote global market popularization of plant-derived 10-DAB III.

Strict restriction on wild Taxus resource exploitation

Regulatory bans on wild Taxus harvesting push standardized cultivated Taxus as exclusive raw material source, stabilizing orderly supply pattern of formal qualified manufacturers.

Market Challenges

Unstable yield fluctuation of Taxus raw material

Taxus growth cycle is long, climate change, planting scale adjustment directly affect leaf output, causing periodic raw material price volatility and impacting production cost of 10-DAB III.

High purification technical threshold for high-pharma-grade products

High-end 98% and above purity products require sophisticated refining process and precision testing equipment; core purification technologies are concentrated in leading enterprises, raising R&D investment for new market participants.

Intensified low-end price competition among manufacturers

Excess low-purity crude intermediate capacity triggers vicious price competition, squeezing gross profit space of regular manufacturers producing qualified pharmaceutical-grade 10-DAB III.

Strict quality certification and long downstream qualification audit

Products for overseas API factories need DMF, pharmacopoeia compliance certification; downstream pharmaceutical customers carry out lengthy supplier qualification verification, delaying new supplier order access.

Alternative biosynthetic process industrialization impact

Cell culture and biosynthesis routes for 10-DAB III are gradually industrialized; mature alternative technology in the future will bring substitution pressure to traditional plant extraction manufacturers.
