Abstracts

The global 1080p Projector market size is predicted to grow from US\$ 2834 million in 2025 to US\$ 4742 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

Global sales of 1080p projectors are projected to reach 15.57 million units by 2025, with an average price of \$186 per unit.

A 1080p projector is a projection device that supports Full HD resolution (1920x1080 pixels). It provides a clearer image than 720p (HD) and is a common choice for home entertainment and business offices. Utilizing progressive scan technology, it projects detailed images, making it particularly suitable for playing movies and displaying graphic content.

The main components of a 1080p projector are the optical engine, light source, and driver board. The optical engine (including DMD chip or 3LCD board, prism, and lens assembly) accounts for 45-50% of the total cost, making it the largest component. The light source module (LED/laser, heat sink, fan) accounts for another 15-20%, while the main control board, power supply, structural components, and packaging together account for approximately 25-30%. Because 0.47" DMD devices and high-end LED/laser chips are still mainly supplied by foreign companies such as Texas Instruments and Osram, most domestic manufacturers can only source optical engines from external suppliers. This results in limited bargaining power for core components, and raw material costs consistently account for over 90% of the total BOM (Bill of Materials).
