Natural boron is composed of two stable isotopes, 10B and 11B, with contents of 19.78% 10B and 80.22% 11B respectively. 10B has a very strong neutron absorption capacity, so it is used as a neutron moderator in nuclear reactors to control the operation of the reactor. On the contrary, 11B hardly absorbs neutrons, so it is used as a dopant in the manufacturing process of semiconductor devices, which can effectively improve the conductivity and radiation and interference resistance of semiconductor devices.
