Abstracts

The global 1,1,3,3-Tetramethylguanidine Hydrochloride market size is predicted to grow from US\$ 8.41 million in 2025 to US\$ 13.47 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

Tetramethylguanidine Hydrochloride (CAS 1729-17-5, molecular formula C₅H₁₄CIN₃, molecular weight 151.64) is a fine chemical guanidine salt, available in both solid and solution forms. The product is primarily used in the production of tetramethylguanidine free base, deep eutectic solvents, catalytic salts, perovskite additives, and fine chemical synthesis, with an estimated overall gross margin of 48%.

Tetramethylguanidine hydrochloride is a small-volume, high-value, and dispersed specialty guanidine product. The global market size is estimated at USD 8.6 million in 2025 and USD 9.2 million in 2026. Its mainstream supply form is solid dry product at approximately 98% purity, and it has not yet developed a significant bulk supply-demand structure.

Demand growth is primarily driven by traditional fine synthesis applications such as tetramethylguanidine free base and catalytic salts, green solvent systems including deep eutectic solvents, and emerging materials research such as perovskite photovoltaic additives.

The market is expected to grow at a CAGR of approximately 6.7% from 2026 to 2032, supported by small-batch synthesis in pharmaceuticals and fine chemicals, customized ionic liquids, green solvents, and photovoltaic material additives. Due to small batch sizes, high purity and COA requirements, and long customer validation cycles, price elasticity is limited, and gross margins are expected to remain around 48%. However, if

perovskites or functional ionic liquids achieve large-scale applications, the market ceiling could increase further.
