Abstracts

The global 12-inch Reclaimed Wafer market size is predicted to grow from US\$ 595 million in 2025 to US\$ 1089 million in 2032; it is expected to grow at a CAGR of 9.2% from 2026 to 2032.

Reclaimed Wafer are wafers that are reused in the semiconductor manufacturing process. Wafer reclaiming is the process of refurbishing and reusing wafers that have defects or are no longer suitable for their original purpose. Instead of discarding these wafers, wafer reclaiming services provide a cost-effective and environmentally friendly solution to recover their value. The process involves removing the old layers, polishing the wafers, and applying new films, thereby restoring them to a usable state. 12-inch or 300mm wafers are the most mainstream currently and account for the highest market share in the recycled wafer market.

Global key players of Reclaimed Wafer include RS Technologies, Kinik, Phoenix Silicon International, Hamada Rectech, Mimasu Semiconductor Industry, etc. The top five players hold a share over 74%. China Taiwan is the largest market, which has a share about 46%, followed by Japan and United States with a market share of 33% and 7%, respectively. In terms of product type, Dummy Wafers is the largest segment, occupied for a share of 78%. And in terms of application, IDM is the largest segment, which has a share about 70%.

The driving force behind wafer Reclaimed Wafer mainly stems from the semiconductor industry's growing demand for cost control, environmental protection, and sustainable resource utilization. As global consumption of electronic products continues to rise, the scale of the semiconductor industry expands, leading to a significant increase in the demand for raw materials, especially silicon wafers. However, the extraction and

processing of high-purity silicon not only consume a large amount of energy and are costly but also pose environmental pressures. Therefore, recycling and reusing old or defective wafers has become a way to reduce financial burdens on companies while promoting green production. Additionally, many countries and regions have introduced policies and regulations to encourage the development of a circular economy in response to the United Nations' Sustainable Development Goals (SDGs), further promoting the growth of the wafer reclamation market.

In terms of trends, with technological advancements and increased environmental awareness, wafer reclamation services are developing towards more efficient and cleaner directions. On one hand, the industry is actively exploring more advanced processing techniques and methods to improve recovery efficiency and product quality, such as using chemical methods to remove surface contaminants or physical methods to repair minor damages. On the other hand, there is an increasing emphasis on collaboration and information sharing among enterprises to build a closed-loop system covering the entire process from collection to remanufacturing. At the same time, digital transformation is becoming a highlight in this field, where the use of Internet of Things (IoT) and Artificial Intelligence (AI) can achieve precise monitoring and intelligent scheduling of the entire reclamation process, thereby effectively enhancing operational flexibility and response speed. In summary, under the combined influence of multiple factors, wafer reclamation services are poised to become a new business sector that benefits both economic efficiency and social sustainability.
