A 15 ppm Bilge Oily Water Separator is a specialized equipment used on ships and other marine vessels to separate oil and other contaminants from bilge water before it is discharged overboard. The '15 ppm' in the name refers to the International Maritime Organization (IMO) regulations that require the oil content in the discharged water to be less than or equal to 15 parts per million (ppm). Bilge water is a mixture of water, oil, grease, and other contaminants that accumulate in the lowest part of the ship's hull (the bilge) due to various activities on board, such as machinery operation, fuel transfer, and cargo loading. It is essential to treat bilge water before releasing it into the sea to prevent pollution and comply with environmental regulations. The 15 ppm Bilge Oily Water Separator works by using a series of physical and chemical processes to separate oil and other contaminants from the water. The separator typically consists of coalescing elements, filters, and oily water monitoring systems to ensure the efficiency of the separation process.
