A 15ppm (parts per million) Oily Water Separator is a piece of equipment commonly used on ships and marine vessels to separate oil and other contaminants from oily wastewater before it is discharged into the sea. The term '15ppm' refers to the maximum allowable oil contamination level in the treated water that is discharged overboard, as regulated by international maritime laws and regulations, such as MARPOL (International Convention for the Prevention of Pollution from Ships). The Oily Water Separator works by utilizing a combination of gravity separation, coalescence, and filtration techniques to effectively separate oil droplets from water, reducing the oil content to below 15ppm before discharge. The oily wastewater enters the separator, where the oil is separated from the water, and the oil is then collected for proper disposal or further treatment. These separators are crucial for preventing marine pollution and protecting the marine environment from oil contamination. Ships and vessels are required to have these separators installed and properly maintained to ensure compliance with environmental regulations and minimize the impact of oily wastewater discharge on the oceans and waterways.

The global 15ppm Oily Water Separator market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
