2-Axis Ultrasonic Anemometer is a device that measures wind speed and direction using ultrasonic sound waves. It operates by sending sound pulses between pairs of transducers along two perpendicular horizontal axes, detecting the wind's effect on the transit time of the pulses. The differences in transit time are used to calculate the wind's components along each axis, which are then combined to determine the overall wind speed and direction. This type of anemometer is known for its high accuracy, fast response time, and durability due to the absence of moving parts, making it suitable for various meteorological, aviation, marine, and environmental monitoring applications.

The global 2-Axis Ultrasonic Anemometers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
