The global 2-position 3-way Valve market size is predicted to grow from US$ 6186 million in 2025 to US$ 8976 million in 2031; it is expected to grow at a CAGR of 6.4% from 2025 to 2031.

A two-position three-way valve is a reversing valve with two different working positions for its valve core and three interfaces on the valve body that are not connected to each other but can be connected to different pipes in the system. They are the inlet, outlet and control port (also called vent port, reflux port). By shifting the valve core, different channels can be switched to achieve the flow and cutoff control of the medium. The valve core is the core component of the two-position three-way valve and has two working positions. In the initial position, the valve core connects the inlet and one of the outlets; in the other working position, the valve core connects the inlet and the other outlet, and the previous outlet is closed.
