A 2 Way Proportional Valve is a type of control valve designed to regulate the flow rate of a fluid—such as liquid, gas, or steam—through a system with high precision. It features two ports: an inlet and an outlet, which control the flow path. Unlike traditional on/off valves, a 2-way proportional valve modulates the fluid flow based on a proportional control signal, allowing for variable flow rates rather than simply opening or closing completely. This capability is achieved through an actuator that adjusts the valve position in response to the control input, providing smooth and precise control over the process. These valves are widely used in applications requiring fine-tuned fluid control, such as in HVAC systems, industrial automation, chemical processing, and hydraulic systems, where maintaining specific flow conditions is critical for system performance and efficiency.

The global 2 Way Proportional Valve market size is projected to grow from US\$ 469 million in 2024 to US\$ 588 million in 2030; it is expected to grow at a CAGR of 3.8% from 2024 to 2030.
