The global 2D Electronics market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

2D electronics refer to electronic devices or components that are only a few atoms thick, rather than the bulky traditional electronics that we are familiar with.

These 2D materials, such as graphene or molybdenum disulfide, have unique electrical properties due to their thinness, making them promising for various applications in electronics. One example of a 2D electronic device is a transistor, which is a fundamental building block of modern electronics. In traditional transistors, the flow of electrical current is controlled by a gate electrode that alters the conductivity of a semiconductor material. However, in 2D transistors, the gate electrode is made of a thin layer of a 2D material, allowing for more precise control of the current flow. Other applications of 2D electronics include flexible or wearable devices, as the thinness of the materials enables them to be easily integrated into flexible substrates. This opens up possibilities for new form factors in electronics, such as bendable displays or wearable health monitoring devices. 2D materials can exhibit unique optical properties, allowing them to be used in optoelectronics applications. For instance, they can be used to create ultra-thin photodetectors or efficient light-emitting devices.
