2D intracardiac ultrasound (ICE) catheter is a medical device widely used in cardiac interventional surgery. It installs a miniature transducer on the tip of the cardiac catheter and then sends it to the heart cavity through peripheral blood vessels (veins). The transducer emits sound waves, and then the received echoes are processed by computer to form an ultrasound image. This technology can provide high-resolution real-time images of the intracardiac anatomical structure and other intracardiac catheters and equipment, and monitor the hemodynamic status in real time without being hindered by the surrounding structures of the heart, such as ribs, and without the need for general anesthesia.

The global 2D ICE Catheter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
