A two-dimensional stress imager is an instrument that can be used to measure the stress distribution on the surface of an object. It can infer the stress distribution on the surface of an object by measuring parameters such as displacement, deformation, temperature, sound waves, or electric fields. Usually, two-dimensional stress imagers can display the stress distribution on the surface of an object in the form of images, helping engineers or scientists better understand the mechanical properties and behavior of the object. The two-dimensional stress imaging instrument has wide applications in fields such as materials science, mechanical engineering, aerospace, biomedicine, etc.
